(*) The size/length/magnitude of a vector

When i and j are unit vectors along the x and y axes, respectively, then the magnitude of \vec{r} is given as follows:-

$$\overrightarrow{r} = \overrightarrow{ai} + \overrightarrow{bj} \Rightarrow |\overrightarrow{r}| = \sqrt{a^2 + b^2}$$

$$= \begin{bmatrix} a \\ b \end{bmatrix}$$

Again, as stated earlier, the axes don't necessarily have to represent the dimensions of a physical space, and can instead represent any data.

(*) The dot product of two vectors

$$S = \begin{cases} 1 & \text{if } 1 \\ \text{if } 1 \\ \text{if } 1 \end{cases}$$

$$S = \begin{cases} 1 & \text{if } 1 \\ \text{if } 1 \end{cases}$$

$$S = \begin{bmatrix} 2 \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\$$

The dot product is commutative, i.e. $\overrightarrow{r} \cdot \overrightarrow{s} = \overrightarrow{s} \cdot \overrightarrow{r}$

The dot product is distributive over addition, i.e.
$$\vec{r}$$
. $(\vec{s} + \vec{t}) = (\vec{r} \cdot \vec{s}) + (\vec{r} \cdot \vec{t})$
